

How to resolve “Your computer can't connect to the remote computer because an error occurred on the remote computer that you want to connect to”?

Meta Title: How to resolve Your Computer Can't Connect to the Remote Computer error?

Meta Description: Fix 'Computer Can't Connect to Remote Computer' error! And resolve connection issues with our easy solutions

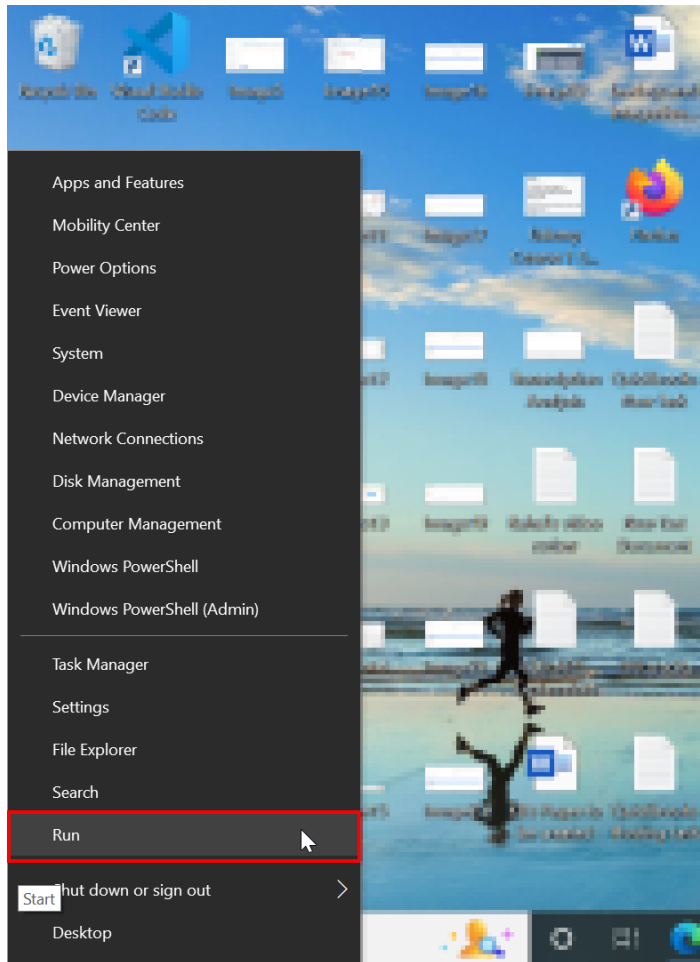

When trying to create a remote connection, it might be annoying to receive an error notice that reads, "Your computer can't connect to the remote computer because an error occurred on the remote computer that you want to connect to." Remote connections are essential for administering systems from a distant location, working collaboratively, or accessing resources. To investigate and fix the issue, it is essential to understand the potential reasons for this error message.

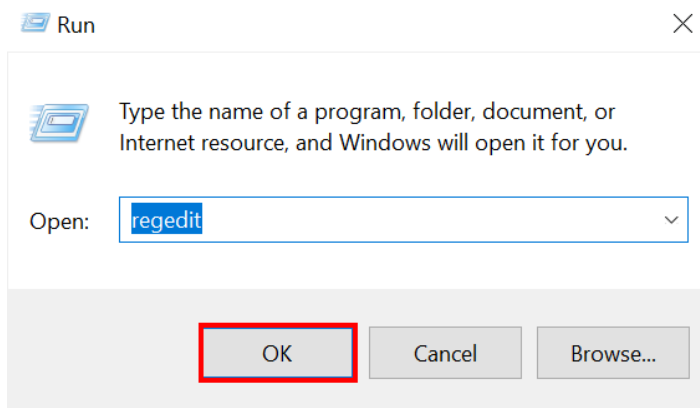

Learn how to resolve this error by following the below methods:

Method 1:

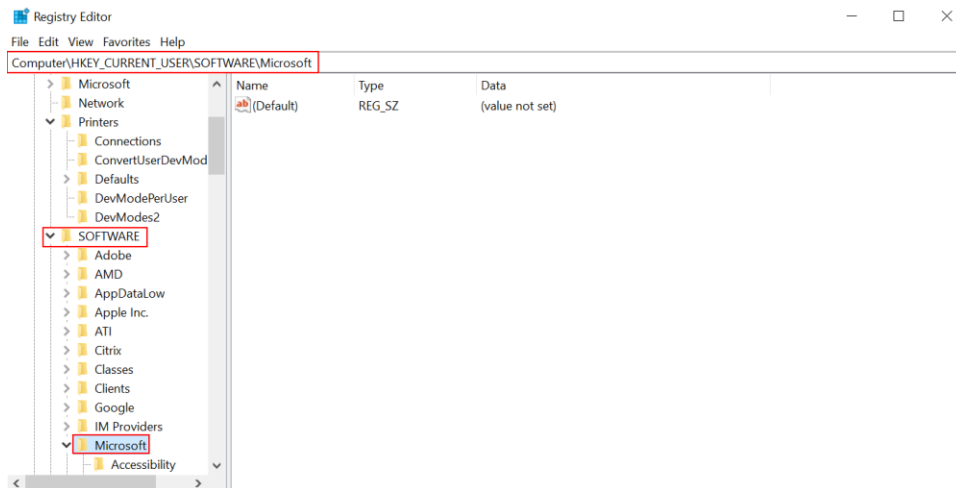

1. Right-click the Start button and select Run.

2. Type "Regedit" in the Run window and then click **OK**.

3. Navigate to the following key: ***HKEY_CURRENT_USER\SOFTWARE\Microsoft\Terminal Server Client***.

4. The **Terminal Server Client** key/folder should be highlighted or selected.
5. Right-click on a blank space on the right-hand side and select **New > DWORD (32-bit) Value**.
6. Give it the name **RDGClientTransport** and a value **1**.
7. After clicking **OK**, the change will be saved. Exit the Registry Editor and try login into the server immediately.

Method 2: Check Your Internet Connection

Ensure that your computer has a working internet connection. Try accessing other websites or services to verify if your internet is functional.

Method 3: Check Firewall and Antivirus

Your local computer's firewall or antivirus software may be blocking the connection. Temporarily disable them to see if that resolves the issue. If it does, you can add an exception for the necessary ports or applications.

Method 4: Try from Different Location/Network

If possible, try connecting from a different location or network to see if the issue is specific to your current network.

Benefits:

Here're the 2 benefits of resolving the error:

- **Regained Remote Access:** You can regain access to the remote machine by fixing the issue. This enables you to resume using crucial resources that are stored on the distant system, including data, programs, and resources. You can go on working productively, interact with colleagues, or administer systems from a different place by regaining remote access.
- **Increased Productivity:** Flexible and convenient remote connections enable users to access resources while on the road or working remotely. By fixing the issue, you can retain productivity wherever you are while having constant access to the distant computer. It makes it unnecessary

for you to be physically present at the remote machine and enables you to finish activities and projects quickly.

Conclusion:

Users can restore remote access, boost productivity, improve collaboration, manage systems more effectively, and experience cost and time savings by fixing the issue blocking the connection to the distant computer. These advantages make working remotely effortless and effective.
